

Ooonana OS

Ooonana OS v1 field guide

What it is

Ooonana OS is a scratch-built Linux project with its own rootfs, boot flow, installer experiments, WSL export, and custom ooonana package manager. Debian or Ubuntu are host build tools only. Alpine APKs are imported into Ooonana .pkg repos; the target OS installs Ooonana packages, not live Alpine APKs.

Editions

minimal: BusyBox-style rootfs, kernel, GRUB disk, installer ISO, WSL rootfs, command line AI.

full-i3: minimal plus i3, Xorg package set, wallpaper, logo assets, GUI installer wizard, AI desktop app, full WSL rootfs.

Package install

```
oonana update
oonana search nano
oonana show nano
oonana get nano --dry-run
oonana get nano
oonana files nano
oonana verify nano
oonana upgrade
oonana remove nano
oonana purge nano
oonana fix nano --reinstall
```

Cloud repo

Default cloud path is GitHub Releases:

oonana-package-repo.tar.gz

<https://github.com/Ooonana/Ooonana-OS/releases/download/packages-latest/oonana-package-repo.tar.gz>

A repo tarball contains index.tsv, SHA256SUMS, *.pkg files, and archives/. ooonana update extracts it into /var/cache/oonana/repos/NAME.

Private GitHub repos need OOOONANA_REPO_TOKEN or OOOONANA_GITHUB_TOKEN for release tarball sync.

Installer

Full-i3 live ISO boots i3 by default. The installer wizard has disk picker, user/password, hostname, theme picker, package repo picker, progress log, failure shell, and reboot prompt.

First boot

oonana setup --first-boot --gui can create user, set password, write network config, choose theme, add cloud repo, and mark setup complete.

WSL

Import full-i3 with scripts/install-wsl-distro.sh --distro Ooonana --tarball /var/tmp/oonana-os/release/oonana-full-i3-wsl-rootfs.tar.gz --force

Launch with: wsl.exe -d Ooonana -- /usr/bin/start-oonana-i3

WSL GUI needs WSLg or an X server with DISPLAY set.

AI

Ooonana AI runs as ooonana ai ... or ooonana-ai. It supports provider setup, model aliases, ask/chat, tools, tasks, audit, history, status, and the full-i3 ooonana-ai-app launcher.

oonana-ai-app is now a native terminal dashboard with quick actions for chat, ask, tools, tasks, sessions, setup, and shell fallback.
