

Ooonana OS

Ooonana OS 0.9.0 field guide

What it is

Ooonana OS is a scratch-built Linux project with its own rootfs, boot flow, installer experiments, WSL export, and custom ooonana package manager. Debian or Ubuntu are host build tools only. Alpine APKs are imported into Ooonana .pkg repos; the target OS installs Ooonana packages, not live Alpine APKs.

Editions

minimal: BusyBox-style rootfs, kernel, GRUB disk, installer ISO, WSL rootfs, command line AI.
full-i3: minimal plus i3, Xorg, Spotlight-style launcher, movable GTK apps, wallpaper, GUI installer, AI desktop app, and full WSL rootfs.

Package install

```
oonana update
oonana search nano
oonana show nano
oonana get nano --dry-run
oonana get nano
oonana files nano
oonana verify nano
oonana upgrade
oonana remove nano
oonana purge nano
oonana fix nano --reinstall
```

Cloud repo

Default cloud path is the GitLab Pages direct repository:
<https://oonana.gitlab.io/oonana-repo>
Run ooonana update && ooonana upgrade. Metadata syncs first; package archives download only when install or upgrade needs them.
GitHub Releases remains a backup tarball repository path.

Installer

Full-i3 live ISO boots i3 by default. The installer wizard has disk picker, partition controls, user/password, hostname, theme and repo pickers, progress log, failure shell, and reboot prompt.

USB live modes

Normal live mode mounts ISO and rootfs read-only. It uses a cleared temporary overlay on OONANA_PERSIST when available on the same boot USB, with RAM fallback.

Persistent live mode accepts only an ext4 OONANA_PERSIST partition on the same physical boot USB. Its full writable overlay saves files, settings, Wi-Fi, Bluetooth pairings, packages, and system changes.

Internal disks are ignored by both live modes. Only the confirmed installer target can be partitioned or formatted.

First boot

oonana setup --first-boot --gui can create user, set password, write network config, choose theme, add cloud repo, and mark setup complete.

WSL

Import full-i3 with scripts/install-wsl-distro.sh --distro Ooonana --tarball /var/tmp/oonana-os/release/oonana-full-i3-wsl-rootfs.tar.gz --force

Launch with: wsl.exe -d Ooonana -- /usr/bin/start-oonana-i3

WSL GUI needs WSLg or an X server with DISPLAY set.

Update an imported distro with: oonana update && oonana upgrade

AI

Ooonana AI runs as ooonana ai ... or ooonana-ai. It supports cloud providers, offline Intel OpenVINO, ask/chat, tools, tasks, audit, history, status, and a native GUI.

The full-i3 desktop includes a ChatGPT-style AI workspace, Settings, Wi-Fi, Bluetooth, Packages, and Spotlight-style application launcher.

Desktop and hardware

The i3 desktop uses solid graphite and orange styling, rounded controls, smooth page transitions, a compact panel, media playback, audio, brightness, power, Wi-Fi, Bluetooth, and wallpaper modes. Default fit mode preserves aspect ratio with solid side bars.

Wi-Fi supports personal and enterprise profiles. NetworkManager, BlueZ, D-Bus, Intel Wi-Fi/Bluetooth firmware, Chromium, Python 3, sudo, su, and doas are included in full-i3.
